

Project Millipede: Naming & Initial Domain Ideation

This document aggregates the initial project naming strategies and product concepts developed for Olsi's engineering management workspace.

Naming Options

1. o1ab (Olsi Lab)

- **Vibe:** Clean, clinical, and personal.
- **Meaning:** Evokes an elite, high-end corporate research and development division.

2. millipede

- **Vibe:** Structural, biological, and technical.
- **Meaning:** The perfect metaphor for a distributed microservices architecture. A millipede consists of dozens of independent legs (services) all operating asynchronously but driving the same unified body forward.

System Concept Brainstorming

Concept 1: The DevSecOps Team Radar (Selected)

- **Objective:** Balance development velocities against security risks to monitor team health without micromanagement.
- **Input Sources:** Git Commits, Jira Transitions, Slack daily pulse webhooks, and manual 1:1 meeting summaries.
- **The Value:** Aggregates unstructured data streams using a customized, local neural network to alert managers of friction points, sprint blocks, or burnout indicators early.

+-----+

Concept 2: The FinOps Guarddog

- **Objective:** Keep infrastructure performance, resource budgets, and cloud expenses synchronized in real time.
- **Mechanism:** Monitors CPU, memory metrics, and cloud billing logs from a local Kubernetes cluster, feeding data into a lightweight anomaly detection pipeline to detect attacks (DDoS) or software regressions (memory leaks).

Concept 3: The Intelligent Incident Commander

- **Objective:** Automate production incident response management.
- **Mechanism:** Simulates a high-traffic e-commerce microservices cluster. Upon detection of service anomalies or web exploits, an AI background agent intercepts system logs, identifies root causes, and drafts post-mortem summaries automatically.
